

Ticket Support System

Web-based application for managing and processing support tickets. Users can create, track, and manage requests, while support staff and administrators centrally manage the processing workflow. Additionally, there is a chatbot for users who have questions about using the website.

Important Note:

The backend is hosted for free on Render, which causes significant latency for the first request, particularly the initial login in the system. This is because the backend goes dormant after a long period and must be restarted by Render.
